

- **People Data API**

Crustdata empowers you to enrich your data with comprehensive information about individuals from multiple public sources. There are three distinct APIs for people data.

- **People Enrichment API**

Allows retrieval of enriched data for one or more LinkedIn profiles in a single request.

Key Features: Multi-profile enrichment in one call, auto-enrichment for unfound profiles within 30-60 minutes, and retrieval of newly enriched data after the auto-enrichment period.

Usage: You can explore and test this API [here](#). Example cURL request:

```
curl 'https://api.crustdata.com/screener/person/enrich?linkedin_ --header 'Authorization: Token $auth_token'
```

- **Tip:** If data for a profile is not immediately available, wait at least 60 minutes before querying again to retrieve the auto-enriched data.

- **LinkedIn Posts API**

Retrieves recent LinkedIn posts and related engagement metrics for a specified person or company.

Key Features: Ideal for fetching recent LinkedIn posts and engagement data for a specific person or company. Results are limited to 20 posts per request. Pagination support is also available for accessing more results.

Usage: You can try out this API [here](#). Example cURL request:

```
curl 'https://api.crustdata.com/screener/linkedin_posts?person_id --header 'Accept: application/json, text/plain, */*' --header 'Accept-Language: en-US,en;q=0.9' --header 'Authorization: Token $auth_token'
```

- **Response:** The response provides a list of recent LinkedIn posts for the specified company, including post content, engagement metrics, and detailed LinkedIn profile information of users who interacted with the posts.

Warning: Data is fetched in real-time from LinkedIn, and the latency for this endpoint is between 30 to 60 seconds, depending on the number of reactions for all the posts on the page.
